

**Problem 1):** Let  $x, y, e, x^{-1} \in \mathcal{G}$  where  $e \in \mathcal{G}$  is the identity element of  $\mathcal{G}$  and  $x^{-1}$  is such that both  $x x^{-1} = e = x^{-1} x$  and  $y x^{-1} = e = x^{-1} y$  hold. Therefore we have

$$x x^{-1} = y x^{-1} \quad (1.1)$$

$$x x^{-1} = x^{-1} y \quad (1.2)$$

$$x^{-1} x = y x^{-1} \quad (1.3)$$

$$x^{-1} x = x^{-1} y \quad (1.4)$$

By applying the cancelation rule ( $ab = ac \Rightarrow b = c$  for  $a, b, c \in \mathbb{G}$  for any group  $\mathbb{G}$ ) to the expression in 1.1 and 1.4, it is clear that we have

$$x = y \quad (1.5)$$

Since  $\mathcal{G}$  is abelian, we may rewrite the expression in 1.2 as

$$x x^{-1} = x^{-1} x = x^{-1} y$$

or

$$x x^{-1} = y x^{-1} = x^{-1} y$$

From either expression, the application of the cancelation rule yields the same result as in expression 1.5. Similarly, we use the abelian property of  $\mathcal{G}$  to rewrite the expression in 1.3 as

$$x^{-1} x = x x^{-1} = y x^{-1}$$

or

$$x^{-1} x = x^{-1} y = y x^{-1}$$

Again, applying the cancelation rule to either expression yields the same result as in 1.5. Therefore, every element in an abelian group must have a unique inverse.

□

**Problem 2):** Let  $\mathcal{G}$  be a finite group and  $g \in \mathcal{G}$ . Now define  $\langle g \rangle \equiv g^0, g^1, g^2, \dots, g^k, \dots$ , where  $k \in \mathbb{N}$ .

Beginning with the multiplicative case, let  $m, n \in \mathbb{N}$  so that we have

$$g^m g^n = g^{m+n}$$

Since  $m, n \in \mathbb{N}$  and  $\mathbb{N}$  is closed under addition,  $(m+n) \in \mathbb{N}$ , it is clear that  $g^{m+n} \in \langle g \rangle$ . Therefore,  $\langle g \rangle$  is closed under its operation. From our definition of  $\langle g \rangle$ , we know that  $g^0 \in \langle g \rangle$ . Additionally,  $g^0 \equiv e = 1$ ; therefore  $\langle g \rangle$  contains the identity element. Now, let  $m \in \mathbb{Z}^+$  and write  $g^{-m} g^m$ . Using  $g^{-m} \equiv (g^{-1})^m$ , this yields

$$g^{-m} g^m = (g^{-1})^m g^m = (g^{-1} g)^m = (e)^m = e = 1$$

which implies the existence of an inverse for each element in  $\langle g \rangle$ . Finally, let  $m, n, k \in \mathbb{N}$ , then we have

$$g^m (g^n g^k) = g^m (g^{n+k}) = g^{m+(n+k)} \tag{2.1}$$

Since  $\mathbb{N}$  is associative under addition, the expression in 2.1 may be rewritten as

$$g^{m+(n+k)} = g^{(m+n)+k} = (g^{m+n}) g^k = (g^m g^n) g^k$$

thereby demonstrating the associativity of operations in  $\langle g \rangle$ . Since  $\mathcal{G}$  is finite, it has order  $m = |\mathcal{G}|$ . Therefore, the elements of  $\langle g \rangle$  will be repeats of elements in  $\mathcal{G}$  starting with  $g^{m+1}$ . Moreover, this means that  $\langle g \rangle \subseteq \mathcal{G}$ , thus satisfying the last condition for  $\langle g \rangle$  to be a sub-group of  $\mathcal{G}$ .

Continuing with the additive case, let  $m, n \in \mathbb{N}$  so that we have

$$m \times g \ n \times g = (m + n) \times g$$

Since  $m, n \in \mathbb{N}$  and  $\mathbb{N}$  is closed under addition,  $(m + n) \in \mathbb{N}$ , it is clear that  $(m + n) \times g \in \langle g \rangle$ . Therefore,  $\langle g \rangle$  is closed under its operation. From our definition of  $\langle g \rangle$ , we know that  $0 \times g \in \langle g \rangle$ . Additionally,  $0 \times g \equiv e = 0$ ; therefore  $\langle g \rangle$  contains the identity element. Now, let  $m \in \mathbb{Z}^+$  and write  $(-m) \times g \ m \times g$ . Using  $(-m) \times g \equiv m \times (-g)^m$ , this yields

$$(-m) \times g \ m \times g = m \times (-g) \ m \times g = m \times (-g \ g) = m \times (e) = e = 0$$

which implies the existence of an inverse for each element in  $\langle g \rangle$ . Finally, let  $m, n, k \in \mathbb{N}$ , then we have

$$m \times g \ (n \times g \ k \times g) = m \times g \ ((n + k) \times g) = (m + (n + k)) \times g \quad (2.2)$$

Since  $\mathbb{N}$  is associative under addition, the expression in 2.2 may be rewritten as

$$(m + (n + k)) \times g = ((m + n) + k) \times g = (m + n) \times g \ k \times g = (m \times g \ n \times g) \ k \times g$$

thereby demonstrating the associativity of operations in  $\langle g \rangle$ . Since  $\mathcal{G}$  is finite, it has order  $m = |\mathcal{G}|$ . Therefore, the elements of  $\langle g \rangle$  will be repeats of elements in  $\mathcal{G}$  starting with  $(m + 1) \times g$ . Moreover, this means that  $\langle g \rangle \subseteq \mathcal{G}$ , thus satisfying the last condition for  $\langle g \rangle$  to be a sub-group of  $\mathcal{G}$ .

**Problem 3):** Since  $\mathbb{Z}_p^* \equiv \{a \in \{1, 2, \dots, p-1\} \mid \gcd(a, p) = 1\}$ , for any  $p \in \mathbb{Z}^+$ , the set of possible elements for  $\mathbb{Z}_{p^e}^*$  is defined as

$$\mathbb{Z}_{p^e}^* \subset \{1, 2, \dots, p^e - 1\} \quad (3.1)$$

This implies the following relation between the cardinalities of these sets

$$|\mathbb{Z}_{p^e}^*| < |\{1, 2, \dots, p^e - 1\}|,$$

where  $|\{1, 2, \dots, p^e - 1\}|$  has the value  $|\{1, 2, \dots, p^e - 1\}| = (p^e - 1)$ . It follows that the value of  $|\mathbb{Z}_{p^e}^*|$  can be obtained by determining the set of all values in  $\{1, 2, \dots, p^e - 1\}$  that do not satisfy the condition given in 3.1 and subtracting the cardinality of this set from  $(p^e - 1)$ . Since the common multiple is  $p$ , we will write this set in terms of  $p$ . Thus, the set of values in  $\{1, 2, \dots, p^e - 1\}$  that do not satisfy the condition in 3.1 may be defined as

$$\{p, 2p, 3p, \dots, pp, 2pp, 3pp, \dots, p^2p, \dots, (p^{e-1} - 1)p\}$$

This definition arises because only multiples of  $p$  do not satisfy the condition in 3.1 and because  $(p^{e-1} - 1)p = p^e - p$  is the largest element of  $\{1, 2, \dots, p^e - 1\}$  that does not satisfy the condition in 3.1. The cardinality of this set,  $\{p, 2p, 3p, \dots, pp, 2pp, 3pp, \dots, p^2p, \dots, (p^{e-1} - 1)p\}$  is clearly

$$|\{p, 2p, 3p, \dots, pp, 2pp, 3pp, \dots, p^2p, \dots, (p^{e-1} - 1)p\}| = (p^{e-1} - 1)$$

Subtracting this value from  $|\{1, 2, \dots, p^e - 1\}| = (p^e - 1)$  finally yields

$$\phi(p^e) = (p^e - 1) - (p^{e-1} - 1) = p^e - 1 - p^{e-1} + 1 = p^e - p^{e-1} = p^{e-1}(p - 1)$$

as desired.

To show that

$$\phi(pq) = \phi(p) \phi(q)$$

holds for any relatively prime  $p$  and  $q$ , we apply a similarly strategy to the one used above. The number of possible elements of  $\mathbb{Z}_{pq}^*$  is  $pq - 1$ . As before, we must take into account that some possible elements of  $\mathbb{Z}_{pq}^*$  will not satisfy the definition in 3.1. If we subtract the number of these elements, then we will have  $\phi(pq) = |\mathbb{Z}_{pq}^*|$ . Since there are  $p - 1$  multiples of  $q$  that do not satisfy the condition in 3.1, we must subtract  $p - 1$  from  $pq - 1$ . Similarly, since there are also  $q - 1$  multiples of  $p$  that do not satisfy the same condition, we must also subtract  $q - 1$  from  $pq - 1$ . Carrying out these subtractions gives

$$\begin{aligned} \phi(pq) &= (pq - 1) - (p - 1) - (q - 1) \\ &= pq - 1 - p + 1 - q + 1 \\ &= pq - p - q + 1 \\ &= (p - 1)(q - 1) \\ &= \phi(p) \phi(q) \end{aligned}$$

since  $\phi(p)$  and  $\phi(q)$  are defined as  $\phi(p) = p - 1$  and  $\phi(q) = q - 1$ , respectively.

We will now use the previous result to show that, for an integer  $N = \prod_i \{p_i^{e_i}\}$  and  $p_i$  distinct primes, we have

$$\phi(N) = \prod_i \{p_i^{e_i-1} (p_i - 1)\}$$

To begin, we substitute  $N = \prod_i \{p_i^{e_i}\}$  for  $N$  in the previous expression. This gives

$$\phi(N) = \phi\left(\prod_i \{p_i^{e_i}\}\right)$$

Using the result  $\phi(pq) = \phi(p) \phi(q)$ , we have

$$\phi(N) = \prod_i \{\phi(p_i^{e_i})\}$$

Finally, we apply the result  $\phi(p^e) = p^{e-1}(p-1)$  to obtain

$$\phi(N) = \prod_i \{p_i^{e_i-1}(p_i-1)\}$$

as expected.

**Problem 4):** We denote the cross product of groups  $\mathcal{G}$  and  $\mathcal{H}$  as  $\mathcal{G} \times \mathcal{H}$  and define it by

$$(g, h) \circ (g', h') \equiv (g \circ_{\mathcal{G}} g', h \circ_{\mathcal{H}} h') \quad (4.1)$$

To show that  $\mathcal{G} \times \mathcal{H}$  is a group, we begin by proving closure under its operation. Since  $\mathcal{G}$  and  $\mathcal{H}$  are groups, then we have  $(g \circ_{\mathcal{G}} g') \in \mathcal{G}$  and  $(h \circ_{\mathcal{H}} h') \in \mathcal{H}$ . Thus  $\mathcal{G} \times \mathcal{H}$  is closed under its operation. Next, we must show the existence of an identity in  $\mathcal{G} \times \mathcal{H}$ . If we modify the expression in 4.1 so that  $g' = e_{\mathcal{G}}$  and  $h' = e_{\mathcal{H}}$ , then we have

$$\begin{aligned} (g, h) \circ (e_{\mathcal{G}}, e_{\mathcal{H}}) &= (g \circ_{\mathcal{G}} e_{\mathcal{G}}, h \circ_{\mathcal{H}} e_{\mathcal{H}}) \\ &= (g, h) \end{aligned}$$

Therefore,  $\mathcal{G} \times \mathcal{H}$  contains an identity element and it is defined as  $(e_{\mathcal{G}}, e_{\mathcal{H}})$ . Next, we must demonstrate

the existence of inverses in  $\mathcal{G} \times \mathcal{H}$ . To do this, we again modify the expression in 4.1. This time we substitute  $g' = g^{-1}$  and  $h' = h^{-1}$ . Applying this substitution to the expression in 4.1 gives

$$\begin{aligned}(g, h) \circ (g^{-1}, h^{-1}) &= (g \circ_{\mathcal{G}} g^{-1}, h \circ_{\mathcal{H}} h^{-1}) \\ &= (e_{\mathcal{G}}, e_{\mathcal{H}})\end{aligned}$$

Thus,  $\mathcal{G} \times \mathcal{H}$  contains inverses for each of its elements. Lastly, we show that associativity holds in  $\mathcal{G} \times \mathcal{H}$ . We begin with

$$\begin{aligned}((g_1, h_1) \circ (g_2, h_2)) \circ (g_3, h_3) &= (g_1 \circ_{\mathcal{G}} g_2, h_1 \circ_{\mathcal{H}} h_2) \circ (g_3, h_3) \\ &= ((g_1 \circ_{\mathcal{G}} g_2) \circ_{\mathcal{G}} g_3, (h_1 \circ_{\mathcal{H}} h_2) \circ_{\mathcal{H}} h_3)\end{aligned}\tag{4.2}$$

Using the associativity of  $\mathcal{G}$  and  $\mathcal{H}$ , we have

$$((g_1 \circ_{\mathcal{G}} g_2) \circ_{\mathcal{G}} g_3, (h_1 \circ_{\mathcal{H}} h_2) \circ_{\mathcal{H}} h_3) = (g_1 \circ_{\mathcal{G}} (g_2 \circ_{\mathcal{G}} g_3), h_1 \circ_{\mathcal{H}} (h_2 \circ_{\mathcal{H}} h_3))$$
